Body

Pipeline Requirements Checklist: Documentation Agent

****Purpose**:** Validate the quality of the discovery, classification, deduplication, and validation requirements for markdown artifact processing. ****Created**:** 2026-07-16 ****Feature**:** [spec.md](../spec.md)

Requirement Completeness

- [] CHK001 Are the supported discovery locations for markdown artifacts explicitly defined for both Spec Kit and Kiro artifacts? [Completeness, Spec §6.2] - [] CHK002 Are the classification rules for recognized artifact names and paths explicitly documented, including the fallback to "other" for unrecognized files? [Completeness, Spec §6.2] - [] CHK003 Are the rules for determining the source tool from the path prefix clearly specified? [Completeness, Spec §6.2] - [] CHK004 Are the expected behaviors for task-like and user-story-like content explicitly covered in the requirements? [Completeness, Spec §6.3] - [] CHK005 Are the validation failure outcomes explicitly defined for missing headings and misclassified task/user-story content? [Completeness, Spec §6.4]

Requirement Clarity

- [] CHK006 Is the deduplication rule stated clearly enough to show that content-hash comparison happens before any AI-related work begins? [Clarity, Spec §6.1] - [] CHK007 Is the distinction between recognized and unrecognized artifact types clear enough that unrecognized files are still ingested rather than ignored? [Clarity, Spec §6.2] - [] CHK008 Are the task and user-story classification conditions described with sufficient precision to avoid ambiguity? [Clarity, Spec §6.3] - [] CHK009 Is the validation rule stated in a way that makes clear which content patterns must not be classified as "normal"? [Clarity, Spec §6.4] - [] CHK010 Does the spec define what information must be returned when validation rejects output so the caller can retry deliberately? [Clarity, Spec §6.4]

Requirement Consistency

- [] CHK011 Do the discovery and classification requirements align with the requirement that both Spec Kit and Kiro artifact trees must be processed? [Consistency, Spec §6.2] - [] CHK012 Do the deduplication and validation requirements align with the requirement that the pipeline must not perform AI work before the content-hash check? [Consistency, Spec §6.1] - [] CHK013 Do the validation rules align with the requirement that task/user-story content must be structurally distinguished rather than folded into generic prose? [Consistency, Spec §6.3] - [] CHK014 Do the requirements avoid conflicting behavior between the agent-native path and the hook-fallback path for classification and ingestion? [Consistency, Spec §6.2]

Acceptance Criteria Quality

- [] CHK015 Can the success of discovery and classification be judged objectively from the requirements alone? [Acceptance Criteria, Spec §6.2] - [] CHK016 Can the deduplication behavior be tested objectively without relying on implementation-specific assumptions? [Acceptance Criteria, Spec §6.1] - [] CHK017 Can validation failures be judged objectively by checking whether the specified headings or misclassified sections are reported? [Acceptance Criteria, Spec §6.4]

Scenario Coverage

- [] CHK018 Are requirements defined for files with ambiguous or unrecognized names that still need to be ingested? [Coverage, Gap, Spec §6.2] - [] CHK019 Are requirements defined for unchanged content that should produce no new render or new version? [Coverage, Spec §6.1] - [] CHK020 Are requirements defined for content that should be rejected when task/user-story patterns are misclassified as "normal"? [Coverage, Spec §6.4] - [] CHK021 Are requirements defined for the case where a heading exists in the source markdown but is missing from the structured output? [Coverage, Spec §6.4]

Notes

- This checklist is intentionally focused on requirement quality for the pipeline rules described in §6.2–§6.4. - Items should be marked complete only when the requirement itself is explicit, measurable, and consistent with the feature spec.
